A Patch of Clover That Comments on Land Use

By Juanita Scott

The 150-year-old property that housed the former Museum of Natural History's old diorama building has a new role at its core.

What was once a garage and utility space is now a small garden, a spot for teachers and students to learn about the impact of urban development on the natural world.

The space is part of a larger initiative to create more green spaces in New York City, which is facing a growing population and limited open space.

The garden is part of a larger project called the New York City Green Infrastructure Program, which aims to create more green space and improve the city's resilience to climate change.

The garden is located in the heart of the city, near Central Park, and is open to the public. It features a variety of plants and trees, including native species that are adapted to the city's climate.

The garden provides an opportunity for city residents to learn about the importance of green spaces and how they can help to create a more sustainable city.

The garden is also a place for community events and activities, including workshops and art installations that encourage people to think about the role of green spaces in the city.
